About the CHAUVIN ARNOUX GROUP

Founded in 1893 by Raphaël Chauvin and René Arnoux, CHAUVIN ARNOUX is an expert in the measurement of electrical and physical quantities in the industrial and tertiary sectors. Total control of product design and manufacturing in-house enables the Group to innovate constantly and to propose a very broad product and service offering meeting all its customers’ needs.

The Group’s quality policy enables it to deliver products which comply with the specifications, as well as the international and national standards, in the metrological, environmental and user-safety sectors.

"CHAUVIN ARNOUX is a major force on the measurement market in France and internationally"

INTRODUCTION

Clamp are designed to extend the current measuring capabilities of DMMs, power instruments, oscilloscopes, hand-held scopes, recorders or loggers, and other diverse instruments. The clamp is placed around the current-carrying conductor to perform non-contact current measurements without interrupting the circuit under test. The clamp outputs current or voltage signals directly proportional to the measured current, thereby providing current measuring and displaying capabilities to instruments with low current or voltage inputs.

When making a measurement, the current-carrying conductor circuit is not broken and remains electrically isolated from the instrument’s input terminals. As a result, the instrument’s low input terminal may be either floated or earthed. It is not necessary to interrupt the power supply when using a current clamp for taking measurements, so costly downtime can be eliminated.

True RMS measurements within the clamp’s frequency response are possible by using most Chauvin Arnoux current clamps with a true RMS multimeter.

In most cases, RMS measurements are not limited by the clamps, but by the instrument to which they are connected. Best results are provided by clamps offering inherent high accuracy, good frequency response, and minimal phase shift.

Several Chauvin Arnoux® clamps are patented for their unique circuitry and design.

AC CURRENT CLAMPS

• Theory of Operation:
  An AC current clamp may be viewed as a variant of a simple current transformer.

  A transformer (figure 1) is essentially two coils wound on a common iron core. A current I1 is applied through the coil B1, inducing through the common core a current I2 in the coil B2. The number of turns of each coil and the current are related by:

  \[ N_1 \times I_1 = N_2 \times I_2 \]

  where \( N_1 \) and \( N_2 \) are the number of turns in each coil.

  From this relationship:

  \[ I_2 = N_1 \times I_1/N_2 \]

  where \( N_1 \) and \( N_2 \) are the number of turns in each coil. The number of turns of each coil and the current are related by:

  \[ \text{The number of turns of each coil and the current} \]

  are related by: \( N_1 \times I_1 = N_2 \times I_2 \)

  where \( N_1 \) and \( N_2 \) are the number of turns in each coil. The number of turns of each coil and the current are related by:

  \[ I_2 = N_1 \times I_1/N_2 \]

  where \( N_1 \) and \( N_2 \) are the number of turns in each coil. The number of turns of each coil and the current are related by:

  \[ \text{The number of turns of each coil and the current} \]

  are related by: \( N_1 \times I_1 = N_2 \times I_2 \)

  where \( N_1 \) and \( N_2 \) are the number of turns in each coil.

  The number of turns in the winding of the clamp is usually a whole number (e.g., 100, 500 or 1,000). If \( N_2 \) equals 1000, then the clamp has a ratio of \( N_1/N_2 \) or \( 1/1000 \), which is expressed as \( 1000:1 \).

  Another way to express this ratio is to say that the clamp's output is \( I_1 \) - the clamp output is \( I_1 \) for \( I_2 = I_1 \times N_1/N_2 \).

  This same principle is applied to a current clamp (figure 2). The articulated magnetic core holds the coil B2 and clamps onto a conductor where the current I1 is flowing.

  B1 is simply the conductor where the user is measuring the current with the number of turns \( N_1 \) equal to one. The current sensor clamped around the conductor provides an output proportional to the number of turns in its coil B2, such that:

  \[ I_2 \text{ (clamp output)} = N_1/N_2 \times I_1 \]

  where \( N_1 = 1 \) or clamp output = \( I_1/N_2 \) (number of turns in the clamp’s coil).

  It is often difficult to measure I1 directly because of currents which are too high to be fed directly into a meter or simply because breaking into the circuit is not possible. To provide a manageable output level, a known number of turns is made on the clamp’s coil.

  The clamp output is connected to a DMM set on the AC current range to handle the clamp output. Then, to determine the current in the conductor, multiply the reading of the DMM by the ratio (e.g., 150 mA read on the 200 mA DMM range represents 150 mA x 1000 = 150 A in the conductor measured).

  The most common application is the use of a current clamp with a digital multimeter. Take as an example a current clamp with a ratio of 1000:1 (model C100) with an output of 1 mA/A. This ratio means that any current flowing through the probe jaws will result in a current flowing at the output:

<table>

<td>750 mA</td>
</tr>
<tr>
<td>250 A</td>
<td>250 mA</td>
</tr>
<tr>
<td>10 A</td>
<td>10 mA</td>
</tr>
</tbody>
</table>

  The clamp output is connected to a DMM set on the AC current range to handle the clamp output. Then, to determine the current in the conductor, multiply the reading of the DMM by the ratio (e.g., 150 mA read on the 200 mA DMM range represents 150 mA x 1000 = 150 A in the conductor measured).

  Current clamps may be used with other instruments with current ranges, provided that these instruments have the required input impedance (see figure 3).

  Current clamps also have AC or DC voltage outputs to accommodate current measurements with instruments (loggers, scopes, etc.) with voltage ranges only (figures 4 and 5).

  This is simply done by conditioning the current clamp output inside the clamp to provide voltage (e.g., model Y4N or MINI09). In these cases, probe mV output is proportional to the measured current.
**Current clamps**

**A modern method for measuring electrical currents**

- **Operating principle**

  The AmpFlex® and MiniFlex® sensors are based on the principle of the Rogowski coil. The primary circuit is constituted by the conductor carrying the alternating current to be measured, while the secondary is formed by a special coil wound on a flexible support. At its terminals, this coil develops a voltage proportional to the derivative of the primary current to be measured:

  \[ u = \frac{\mu_0 n}{2\pi r} \times S \frac{di}{dt} \]

  where 
  - \( \mu_0 \) = vacuum permeability
  - \( S \) = surface area of a turn
  - \( n \) = number of turns
  - \( r \) = core radius

  This AC voltage \( u \) is then passed via a screened cable to the casing containing all the processing electronics and the battery power supply. Because there are no magnetic circuits on these sensors, they are very lightweight and flexible. Without magnetic circuits, there is no saturation effect or overheating. This feature offers excellent linearity and low phase shift.

- **AC/DC CLAMP-ON CURRENT PROBES**

  - **Theory of Operation (Hall effect)**

    Unlike on traditional AC transformers, AC/DC current measurement is often achieved by measuring the strength of a magnetic field created by a current-carrying conductor in a semiconductor chip using the Hall-effect principle.

    When a thin semiconductor (figure 6) is placed at right angles to a magnetic field \( B \), and a current \( I_d \) is applied to it, a voltage \( V_h \) is developed across the semiconductor. This voltage is known as the Hall voltage, named after the US scientist Edwin Hall who first reported the phenomenon.

    When the Hall device drive current \( I_d \) is held constant, the magnetic field \( B \) is directly proportional to the current in a conductor. Thus, the Hall output voltage \( V_h \) is representative of that current.

    Such an arrangement has two important benefits for universal current measurement. First, since the Hall voltage is not dependent on a reversing magnetic field, but only on its strength, the device can be used for DC measurement. Second, when the magnetic field strength varies due to varying current flow in the conductor, response to change is instantaneous. Thus, complex AC wave forms may be detected and measured with high accuracy and low phase shift.

  The basic construction of a clamp jaw assembly is shown in figure 7, (note: one or two Hall generators are used depending on the type of current clamp).

  The Chauvin Arnoux AC/DC current clamps were developed using the above principle, together with patented electronic circuitry incorporating signal conditioning for linear output and a temperature compensation network. These have a wide dynamic range and frequency response with highly accurate linear output, for application in all areas of current measurement up to 1,500 A. Direct currents can be measured without the need of expensive, power-consuming shunts, and alternating currents up to several kHz can be measured accurately to respond to the requirements of complex signals and RMS measurements.

  The clamp outputs are in mV (mV DC when measuring DC, and mV AC when measuring AC) and may be connected to most instruments with a voltage input, such as DMMs, loggers, oscilloscopes, handheld scopes, recorders, etc.

  Chauvin Arnoux also offers various technologies for DC measurements, as in the K1 and K2, designed to measure very low DC currents and using saturated magnetic circuit technology. The AC/DC clamps also offer the opportunity to display or measure True RMS in AC or AC+DC.
Current clamps

A modern method for measuring electrical currents

AC OR DC CURRENT MEASUREMENT

• Connect the clamp to the instrument
• Select the function and range
• Clamp the clamp around a single conductor
• Read the conductor’s current value

Examples (figure 8):

AC: clamp model: Y2N
  Ratio: 1000:1
  Output: 1 mA AC/A AC
  DMM: set to 200 mA AC range
  DMM reading: 125 mA AC
  Current in conductor:
  125 mA x 1000 = 125 A AC

DC: clamp model: PAC 21
  1 mV DC/A DC (Hall sensor)
  DMM: set to 200 mA DC range
  DMM reading: 160 mV DC
  Current in conductor: 160 A DC

AC: clamp model: PAC 11
  Output: 1 mA AC/A AC
  (Hall sensor)
  DMM: set to 200 mA AC range
  DMM reading: 120 mA AC
  Current in conductor: 120 A AC

DC: micro clamp K1
  Output: 1 mV/mA
  DMM: set to 200 mA DC range
  DMM reading: 7.4 mA
  Current in conductor: 7.4 mA

MEASUREMENTS OF LOW CURRENTS, PROCESS LOOPS AND LEAKAGE CURRENTS

Numerous clamps are offered for low current measurements. For example, models K1 and K2 have a 50 mA DC sensitivity and the model K2 may be used on 4-20 mA process loops.

Example: 4-20 mA loop

Clamp model: K2
  Output: 10 mV/mA
  DMM: set to 200 mV DC range
  DMM reading: 135 mV DC
  Loop current: 13.5 mA DC

When the current to be measured is too low for the clamp or better accuracy is required, it is possible to insert the conductor multiple times through the probe jaws. The value of the current is the ratio of the reading to the number of turns.

Example: figure 9

Clamp model: C100
  Ratio: 1000:1
  DMM: set to 200 mA AC range
  Turns in clamp jaw: 10
  DMM reading: 60 mA AC
  Current in conductor:
  60 mA x 1000 / 10 = 6,000 mA = 6 A

When the clamp is placed around two conductors with different polarities, the resulting reading will be the difference between the two currents. If the currents are the same, the reading will be zero (figure 10).

Example: figure 10

MINI 05
  Ratio: 1 mV AC/mA AC
  DMM: set to 200 mA AC range
  DMM reading: 10 mA AC
  Leakage current: 10 mA AC

To measure low currents or leakage, you need a clamp which will measure low values, such as the model B102 or C173. However, earth leakage currents may also be measured directly with the simple model (figure 11).

Example: figure 11
SELECTING A CURRENT PROBE

Answering the following questions will help you to select the appropriate clamp for your applications:

1. Determine if you are measuring AC or DC (DC current clamps are categorized as AC/DC because they measure both).

2. What is the maximum current you will measure, and what is the minimum current you will measure? Check that the accuracy at low levels is appropriate, or select a low-current measurement clamp. Most clamps perform with greater accuracy at the upper end of their range. Several clamps are designed to measure very low DC or AC.

3. What size conductor will you clamp onto? This parameter determines the clamp jaw size needed.

4. What type of clamp output do you need or can you work with (mA, mV, AC, DC, etc.)? Check the maximum receiver impedance to ensure that the clamp will perform to specifications.

Other factors you may want to consider:

- What is the working voltage of the conductor to be measured?
- Chauvin Arnoux clamps must not be used above 600 volts (see specifications).
- What type of termination do you need: sockets, banana leads or BNC leads?
- Will the probe be used for harmonics or power clamp? Look at the frequency specifications and phase shift specifications.

**Notes:**
- **Bandwidth (frequency in kHz):** The specified bandwidths are based on a 50% damping factor and a 10 Hz reference point.
- **Input - Connections:**
  - **Current:** The current rating is specified for the maximum available voltage and frequency.
  - **Voltage:** The voltage rating is specified for the maximum available current and frequency.
  - **Bandwidth:** The bandwidth is specified for the maximum available current and voltage.

**To order:**
- The order codes are provided for easy reference.

**Non-contractual document**
- The specifications provided are subject to change without notice.

**Measurement of AC current**
- The measurement of AC current is performed using specialized AC current probes.

**Series and Models:**
- A variety of series and models are available to meet different measurement requirements.

**Selection guide:**
- The selection guide includes important features such as measurement ranges, input/output connections, and specific characteristics.

**General Notes:**
- The products are designed for use in industrial and commercial environments.
- The selection guide is intended for use by professionals with experience in electrical measurements.

**Additional Information:**
- The measurement results are presented in logarithmic units, with a 10 Hz reference point.
- The specifications are based on standardized test procedures.

**Safety Precautions:**
- Always ensure that the power supply is disconnected before making any adjustments or measurements.
- Use appropriate safety gear, including insulated gloves and safety glasses.

**Product Compatibility:**
- The measuring devices are compatible with a wide range of electrical systems and components.

**Limited Liability:**
- The manufacturer disclaims any liability for errors or omissions in the specifications provided.

**Documentation:**
- Additional documentation is available upon request, including detailed installation and operation manuals.

**Contact Information:**
- For further assistance or inquiries, please contact the manufacturer's technical support team.

**Legal Disclaimer:**
- The information provided is for reference only and does not constitute a contractual commitment.

**Technical Specifications:**
- The technical specifications are based on the latest standards and guidelines.

**Evaluation and Approval:**
- The products have been evaluated and approved by relevant regulatory bodies for use in various applications.

**MINI SERIES**

Small, compact and particularly resistant, this range of miniature clamps is designed for measurements from a few milli-amperes to 150 A AC. Their shape makes them very practical in confined spaces, such as circuit-breaker boards, control panels or control boxes. They are ideal for use with multimeters.

There are two types of MINI clamps.

The first type operates like a traditional current transformer and provides a current output (mA) which can be used with multimeters, loggers or instruments with current calibres.

The second provides a voltage output proportional to the current measured. This voltage output enables instruments with AC voltage calibres to display or store current values.

There is also a model with a DC voltage output.

The MINI clamps give True RMS results when used with a True RMS instrument.

**MINI 100 SERIES**

Incorporating all the essentials which made the Miniclamps and the MINI/uni Series so successful, the MINI 100 Series completes the range with a clamping diameter of 16 mm.

The models in the MINI 100 Series are equipped with a so-called “direct reading” input/output ratio and can measure currents up to 350 A.

Current clamp for AC current
Model MINI 01

Calibre | 150 A AC
Sensitivity | 1 mA/A (1000/1)

**DESCRIPTION**
Small and compact, the MINI 01 current clamp is the ideal complement for any multimeter to measure AC currents in low-power tertiary or industrial applications. If there is a current in the conductor clamped, the MINI 01 clamp is protected against overvoltages during disconnection from the measurement instrument.

AC current clamp model MINI 01 with operating manual

| Reference | P01105101Z |

(1) Conditions of reference: 23 °C ± 3 °K, 20% to 75% RH, sinusoidal signal with frequency of 48 Hz to 65 Hz, distortion factor < 1 % with no DC component, external DC magnetic field < 40 A/m, no external AC magnetic field, no external conductor with circulating current, conductor omitted for measurement, measurement instrument load impedance ≤ 10 Ω.

(2) With clamp closed.

(3) Vibrations expressed in mm peak, scanning of 1 octave/minute for 10 minutes on 3 axes.
**DESCRIPTION**

The MINI 02 current clamp, whose jaws are equipped with a high-performance magnetic material and a double coil, offers excellent linearity and improved performance. Small and compact, it is ideal for measuring AC currents in low-power tertiary or industrial applications. If a current is present in the conductor being clamped, the MINI 02 clamp is protected against voltage surges when it is disconnected from the measurement instrument.

### ELECTRICAL SPECIFICATIONS

**Main specifications**
- **Output**: Double-insulated cable 1.5 m long, terminated by 2 insulated elbowed male banana connectors Ø 4 mm
- **Bandwidth**: 48 Hz .. 500 Hz
- **Clamping capacity**: Cable Ø max 10 mm

**Description**
Small and compact, the MINI 05 current clamp is the ideal complement for any multimeter to measure AC currents in low-power tertiary or industrial applications.

With its 2 calibres, it offers excellent resolution for measuring AC currents from 5 mA to 100 A.

AC current clamp model MINI 09 with operating manual
DESCRIPTION
The MINI 102 current clamp, whose jaws are equipped with a high-performance magnetic material and a double coil, offer excellent linearity and improved performance.

If a current is present in the clamped conductor, the MINI 102 clamp is protected against voltage surges when it is connected to the measuring instrument.

AC current clamp model MINI 103 with operating manual

Reference
P01106103
These ergonomic mini-clamps are designed to make light work of measuring low and medium currents from 0.01 A to 240 A AC. The shape of the jaws makes 'hooking' onto cables easy, even in areas of restrictive access. The jaws can grip conductors up to 20 mm in diameter. Depending on the particular model, they have one or two calibres. The output is via either jack sockets or a lead with 4 mm Ø plugs, hence these clamps are compatible with all multimeters and testers on the market.

There are two types of MN series clamps available. The first kind operates as a current transformer (ratio 1,000/1) and gives a current output (mA) for use with any tester with current calibres.

The second type gives a voltage output (DC or AC depending on the model) proportional to the measured current (1, 10, 100 or 1,000 mV/A). This voltage output means that, even with testers without any current calibres, it is possible to measure currents by means of the DC or AC voltage calibres.

There are specific models in the MN series that have been designed with particular applications in mind such as measurement on current transformer outputs, on oscilloscopes and even of leakage currents.

Current clamps for AC current

Models MN10 and MN11

DESCRIPTION
An electronic voltage-limiting system protects output of clamp when operating, if the secondary circuit is opened.

ELECTRICAL SPECIFICATIONS

- Current range: 0.5 A AC .. 240 A AC
- Current transformation ratio: 1000/1
- Output signal: 1 mA AC / A AC (240 mA for 240 A)
- Accuracy and phase shift:
  - Primary current
    - 0.5 A .. 10 A: ± 3 % + 0.5 mA
    - 10 A .. 40 A: ± 2.5 % + 0.5 mA
    - 40 A .. 100 A: ± 2 % + 0.5 mA
    - 100 A .. 150 A: ± 1 % + 0.5 mA
    - 150 A .. 200 A: ± 2 % + 0.5 mA
    - 200 A .. 240 A: ± 3 % + 0.5 mA
  - Phase shift: ≤ 5°

MECHANICAL SPECIFICATIONS

- Operating temperature: -10 °C to +55 °C
- Storage temperature: -40 °C to +70 °C
- Influence of temperature: ≤ 0.15 % of output signal per 10 °K
- Relative humidity for operation: 0 to 85 % RH decreasing linearly above 35 °C
- Load impedance: ≤ 10 Ω
- Maximum current: 200 A continuous for a frequency ≤ 3 kHz
- Maximum output voltage (secondary open): Limited to 8 V peak max.
- Load influence: ≤ 0.5 % of output signal at 50/60 Hz
- Current clamps for AC current
  - MN10: Safety sockets (4 mm)
  - MN11: 1.5 m two-wire lead with double or reinforced insulation terminated by 2 elbowed male safety plugs (4 mm)

SAFETY SPECIFICATIONS

- Electrical safety:
  - Instrument with double insulation or reinforced insulation between the primary, the secondary and the gripable part located under the guard as per IEC 1010-1 & IEC 1010-2-022
  - 600 V category III, pollution degree 2
  - 300 V category IV, pollution degree 2
- Electromagnetic compatibility (EMC):
  - EN 50081-1: class B
  - EN 50082-2:
    - Electrostatic discharge: IEC 1000-4-2
    - Radiated field: IEC 1000-4-3
    - Fast transients: IEC 1000-4-4
    - Magnetic field at 50/60 Hz: IEC 1000-4-8

**DESCRIPTION**

This 200 A AC clamp enables easy display and measurement of “current” curves. It fits any oscilloscope since it has a coaxial lead with BNC plug. It produces a mV signal directly proportional to current. It offers 2 different sensitivities.

**ELECTRICAL SPECIFICATIONS**

Yn SERIES

The Yn series clamps are designed to be both rugged and versatile whilst remaining easy to use. The jaws are designed so that the clamps can be hooked onto cables or clamped onto busbars for current measurement up to 600 A AC.

There are two types of Y series clamps available:

The first acts as a current transformer (ratios of 100:1 or 1000:1), giving an output current that may be read by a multimeter, logger or other suitable devices with appropriate current calibres.

The other kind of Y series clamp has a DC voltage output proportional to the AC current measured, allowing instruments without current calibres to measure, display and record currents on a DC voltage calibre.

There is also a model available specifically for direct use with oscilloscopes.

**DESCRIPTION**
This 500 A AC clamp can be used for the display and measurement of 'current' curves. It comes with a coaxial cable terminated by a BNC plug, thus making it the ideal tool for use with oscilloscopes. It supplies a mV output signal that is directly proportional to the measured current.

"C 100" SERIES

The "C100" series is a range of thirteen transformer clamps with all the advantages of our old "C30" series clamps whilst incorporating considerable improvements, particularly in the field of safety, ergonomics and performance:

- 1,000 A measurement, excellent metrology, high accuracy, high level of linearity, symmetrical coil windings for minimum phase shift, pendular adjusting system for magnetic elements, maximum conductor diameter Ø 52 mm and also some models with μ metal core specially made for wattmeter use.

- Innovative design: excellent ergonomics, handle with finger grips, assisted opening system for jaws (patented system), IEC 1010 600 V cat. III safety (industry and services), antisip protection, conductor anti-pinching system,...

All this technology and manufacturing quality has been combined to provide the best measurement possible without any complications. A "C100" series clamp is compatible with any instrument (multimeter, wattmeter, recorder, oscilloscope...) for safe measurement of AC currents without shutting down the installation.

**Bandwidth:**

30 Hz .. 10 kHz

**Crest factor:**

≤ 6 for a current ≤ 2,000 A peak (300 A rms)

**Maximum currents:**

1,000 A continuous for a frequency ≤ 1 kHz (limitation proportional to the inverse of frequency beyond)

1,200 A for 40 minutes max (interval between measurements > 20 minutes)

**Load impedance:**

≤ 1 Ω (1 VA)

**Operating temperature:**

-10 °C to +50 °C

**Storage temperature:**

+40 °C to +70 °C

**Influence of temperature:**

≤ 0.2 % of output signal per 10 °K

**Relative humidity for operation:**

0 to 85 % RH with a linear decrease above 35 °C

**Influence of relative humidity:**

< 0.1 % of output signal from 10 % to 85 % RH

**Operating altitude:**

0 to 2,000 m

**Max. jaw opening:**

53 mm, patented progressive opening system

**Clamping capacity:**

- Cable: 8 mm², 50 mm²
- Busbar: 1 busbar of 50 x 5 mm / 4 busbars of 30 x 5 mm

**Casing protection rating:**

IP40 (IEC 529)

Oscilloscope clamp for AC current

Model C160 (insulated AC current probe)

Current | 30 A peak | 300 A peak | 2,000 A peak
---|---|---|---
Output | 100 mV/A | 10 mV/A | 1 mV/A

**DESCRIPTION**
This 1,000 A AC clamp can be used for easy display and measurement of current curves. Equipped with a coaxial cable terminated by a BNC connector, it is ideal for use with any oscilloscope. It outputs a signal in mV directly proportional to the current. It offers 3 different sensitivities.

**ELECTRICAL SPECIFICATIONS**

- **Current range:**
  - 0.1 A AC .. 10 A AC (30 A peak)
  - 1 A AC .. 100 A AC (300 A peak)

DESCRIPTION
The C173 clamp measures leakage or differential currents from 1 mA upwards and can also be used with multimeters equipped with a range in mV AC. The C173 clamp measures earth-loop currents and leakage currents. It also locates faults in circuits of single and three-phase networks. For unearthed three-phase systems, use the optional Artificial Neutral.

ELECTRICAL SPECIFICATIONS
- Current range:
  0.001 A .. 1.2 A AC
  0.01 A .. 12 A AC
  0.1 A .. 120 A AC
  1 A .. 1,200 A AC
- Output signal:
  1 V AC / A AC (1 V for 1 A)
  100 mV AC / A AC (1 V for 10 A)
  10 mV AC / A AC (1 V for 100 A)
  1 mV AC / A AC (1 V for 1,000 A)
- Accuracy and phase shift:

  - 1,000 A calibre:
    ≤ 3 for I ≤ 1,700 A peak (500 Anms)
- Maximum currents:
  1,000 A continuous for a frequency ≤ 500 Hz (limitation proportional to the inverse of 1/2 of frequency beyond)
- Load impedance:
  ≥ 10 MO and ≤ 47 pF
- Output impedance:
  - 1 A calibre: 10 kΩ ± 10 %
  - 10 A calibre: 1 kΩ ± 10 %
  - 100 A calibre: 100 Ω ± 10 %
  - 1,000 A calibre: 100 Ω ± 10 %
- Operating voltage:
  600 Vrms
- Common mode voltage:
  600 V category III and pollution degree 2
- Influence of adjacent conductor:
  ≤ 1 mA / A at 50 Hz
- Influence of conductor position in jaws:
  ≤ 0.3 % of output signal for frequencies ≤ 400 Hz
- Influence of frequency:
  - 1 A calibre:

MECHANICAL SPECIFICATIONS

- Operating temperature: -10 °C .. +50 °C
- Storage temperature: -40 °C .. +70 °C
- Influence of temperature: ≤ 0.15 % of output signal per 10 °K from -10 °C .. +40 °C ≤ 0.2 % of output signal per 10 °K from +40 °C .. +50 °C
- Relative humidity for operation: From 0 .. 85 % from RH decreasing linearly above 35 °C
- Influence of relative humidity: < 0.1 % of output signal from 10 .. 85 % from RH
- Operating altitude: 0 to 2,000 m
- Max. jaw opening: 53 mm
- Colours: Dark grey case with red jaws
- Output: 1.5 m two-wire lead with double or reinforced insulation terminated by 2 elbowed male safety plugs (4 mm)

SAFETY SPECIFICATIONS

- Electrical safety: Instrument with double insulation or reinforced insulation between the primary the secondary and the graspable part located under the guard as per IEC 1010-1 & IEC 1010-2-032 - 600 V category III, pollution degree 2 - 300 V category IV, pollution degree 2
- Electromagnetic compatibility (EMC):
  - Electrostatic discharge: IEC 1000-4-2
  - Radiated field: IEC 1000-4-3
  - Fast transients: IEC 1000-4-4
  - Magnetic field at 50/60 Hz: IEC 1000-4-8

The DN series comprises a range of high-performance clamp-on AC current probes designed for high current measurements. Their excellent current transformation ratios and low phase shift, combined with a broad frequency response, allows highly accurate current and power measurements. High-quality magnetic cores and windings mean high precision current measurement up to 3,000 A (AC). The rectangular jaws can be used to clamp large-diameter cables or busbars.

The DN series clamps provide true RMS measurement values and faithful signal reproduction.

There are two different kinds of model available in the DN series: the first acts as a traditional current transformer with a current output (mA) and has a wide range of voltage ratios.

These clamps may also be used with multimeters, harmonic and power measurement equipment, logging apparatus or other instruments allowing AC current input.

The second type of model gives a voltage output in precise proportion to the measured current (1 mV/A, 10 mV/A or 100 mV/A) so you can display and log currents on instruments without current inputs.

Model D38N has been specifically designed for use with oscilloscopes, or other instruments with a BNC input.

**DESCRIPTION**

The D38N offers accurate AC current measurement and a voltage output in mV allowing direct readings on oscilloscopes. A switch with 3 positions on the handle can be used to select the ranges. The wide opening of the jaws means they can be used on cables and small busbars.

**ELECTRICAL SPECIFICATIONS**

- **Current calibres:**
  - 1 A AC .. 30 A AC (90 A peak)

**B SERIES**

The only model in the B series, the B102 is designed to measure earth leakage currents caused by insulation faults. It enables the fault to be located and diagnosed before failure occurs thus avoiding installation shutdown. It is designed specifically for locating low-current faults on high-current circuits. The B102 measures differential or leakage current from 500 μA upwards and may be used to measure currents up to 400 A in continuous use (400 A max.). The B102 has two measurement ranges, 1 mV/mA or 1 mV/A.

As a leakage current detector, the B102 can be used on single or multiphase systems whether the currents are in or out of phase, balanced or unbalanced. The B02 may be used simply as a high-precision clamp-on current probe. With its 115 mm jaw opening and dynamic measurement range from 500 μA to 400 A, the B102 is a versatile instrument, highly useful in the analysis of unbalanced circuits, leakage currents and earth loop currents. When operated in conjunction with an artificial neutral, the B102 can also be used to measure fault currents on 3-phase circuits with no neutral.

### DESCRIPTION

The B102 clamp measures leakage currents or residual currents as low as 500 µA and can be used with multimeters equipped with a calibre in mV AC. The B102 clamp measures the currents flowing in earth loops as well as leakage currents. It can be used on live installations to detect insulation faults on the earth circuits of single and three-phase networks. For three-wire three-phase systems, use the artificial neutral box.

Flexible probes for AC current

MiniFlex® SERIES
Making use of the principle of Rogowski coils, the MiniFlex® models are flexible sensors offering a wide dynamic range for measuring AC currents and viewing high-speed current pulses.

The sensor's output voltage is proportional to the derivative of the current measured in the conductor and requires an electronic system for formatting.

The absence of a magnetic core at the centre of the coil brings several advantages:
- flexibility and light weight
- excellent response to rapid current changes, as it is not possible for induced Fourier currents to occur, so they do not increase the sensor's response time.
- excellent linearity due to the absence of core saturation even when there are very high current, as in the case of electric power transmission, electrical welding or applications involving high-power pulses.

The great care taken when manufacturing our sensors means they benefit from particularly homogeneous winding, with equidistant turns along the whole length of the sensor, thus ensuring good immunity against electromagnetic interference.

The MiniFlex® models are made up of a flexible sensor connected to a casing containing processing electronics which outputs a voltage with the same amplitude and form as the current measured.

• MiniFlex® MA110 series:
With their small diameter and size, the sensors in the MA110 series are ideal for measuring currents in the electrical cabinets of residential or tertiary buildings or in low-power cabinets in industry. The rugged click-together system benefits from IP67 ingress protection.
Available with “banana” or “BNC” connection technology, the MA110 series can be connected directly to a multimeter, a wattmeter or a logger for RMS measurements at the standard industrial frequencies. The casing offers 4 measurement calibres.

• MiniFlex® MA130:
The MA130 sensor, part of the same series as the MA110, can be used to measure currents on three-phase installations. It is equipped with BNC connections with adapters for banana plugs. The processing unit offers 3 measurement calibres. The rugged click-together system has IP67 ingress protection. It can be connected to the AC voltage inputs (mV AC, AC) of any power analyser, logger or other measuring instrument.

• MiniFlex® MA200 series:
The MA200 series is a family of "high-frequency" sensors specially designed for viewing and measuring electrical or electrotechnical signals with wide variations and high amplitude. These "insulated current probes for oscilloscopes" offer a bandwidth of 1 MHz and can be used to analyse currents with complex forms, transients present in electronic power supplies, welding units, etc.

**DESCRIPTION**

The model MA110 MiniFlex® sensor is a flexible sensor comprising an active part (Rogowski coil) linked to a casing containing electronics. Unlike a current clamp with magnetic circuits, the MiniFlex® models are flexible and are not subject to magnetic saturation constraints, so they offer excellent linearity, low phase shift and a large dynamic range for measurement (up to several kA) while remaining easy to use. The sensors’ flexibility makes it simple to clamp and measure any conductor, whatever its type (cable, busbar, strand, etc. and accessibility). The click-lock system for opening and closing the coil is specially designed for use with safety gloves.

The MA110 MiniFlex® sensor can be connected to the AC voltage input of any multimeter with Ø 4 mm female plugs.

The MiniFlex® MA110 model can be powered by batteries or by a standard external power supply. If the power supply fails, the instrument’s batteries take over.

To maximize the battery life, the MiniFlex® MA110 model has an automatic standby system which can be deactivated at start-up to perform long-term measurement campaigns.

The MiniFlex® MA110 model has 3 green, yellow and red LEDs indicating, respectively, the power supply status, the status of the automatic standby function and any overruns of the measurement capacity.

**DESCRIPTION**

The MiniFlex® MA200 is a flexible sensor comprising an active part (Rogowski coil) linked to a casing containing electronics. Unlike a current clamp with magnetic circuits, the MiniFlex® models are flexible and are not subject to magnetic saturation constraints, so they offer excellent linearity, low phase shift and a large dynamic range for measurement (up to several kA) while remaining easy to use.

The oscilloscope probes in the MA200 series are specially designed for viewing alternating currents in order to assess the transition and propagation times on electrotechnical equipment.

The sensors’ flexibility makes it simple to clamp and measure any conductor, whatever its type (cable, busbar, strand, etc. and accessibility.

The click-lock system for opening and closing the coil is specially designed for use with safety gloves.

The casing can be connected to any oscilloscope equipped with an AC voltage input.

SERIE AmpFlex®

These flexible current probes are as at home measuring low AC currents of a few tens mA as they are measuring high currents of several tens of kA. Their main point of interest is their flexibility and the ease with which electrical conductors of all shapes and sizes (cables, busbars) and degrees of accessibility can be gripped. They have a number of other advantages; they are lightweight (no magnetic circuit), they do not suffer from the saturation effect and their high level of accuracy combined with minimal phase shift make them perfect for power measurement applications.

- **AmpFlex® A110 series:**
  The sensors in the A110 Series have a flexible core connected by a shielded cable to a small unit containing processing electronics. This IP54 unit offers 4 measurement calibres and can be connected directly to any multimeter, wattmeter or logger. The length of the sensors in this Series (up to 120 cm as standard) enables you to clamp cables with a large cross-section or several conductors simultaneously. The A110 can be used for measurements up to 30 kA AC. The AmpFlex® A110 offers IP67 ingress protection and can be connected to the AC voltage input (mV AC, V AC) of any multimeter or measuring instrument equipped with Ø 4 mm female banana plugs.

- **AmpFlex® A130:**
  The A130 model is a version of the A110 Series adapted for measurements on three-phase installations. It is equipped with BNC connections. The processing unit offers 3 measurement calibres. The A130 sensor can be connected to the AC voltage inputs (mV AC, V AC) of any power analyser, logger or measuring instrument equipped with BNC plugs.

**DESCRIPTION**

The AmpFlex® A110 is a flexible sensor which comprises an active part (Rogowski coil) and a casing containing an electronic processing unit. Unlike current clamps using magnetic circuits, the AmpFlex® models are flexible sensors without magnetic saturation constraints. As a result, they offer excellent linearity, low phase shift, a large dynamic range for measurement (up to several kA) while remaining easy to use. The sensors’ flexibility makes it easy to clamp the conductor, whatever its type (cable, busbar, strand, etc.) and access conditions.

The design of the click-together opening and closing system means it can be handled with protective gloves. The AmpFlex® A110 can be connected to the AC voltage input (mV AC, V AC) of any multimeter or measuring instrument equipped with Ø 4 mm female banana plugs. The AmpFlex® A110 can be powered by batteries or a standard external power supply. If the power supply fails, the instrument’s batteries take over.

To maximize the battery life, the MiniFlex® A110 has an automatic standby system which can be deactivated at start-up to perform long-term measurement campaigns. The MiniFlex® A110 has 3 green, yellow and red LEDs indicating, respectively, the power supply status, the status of the automatic standby function and any overruns of the measurement capacity.

DESCRIPTION

The AmpFlex® A110 is a flexible sensor which comprises an active part (Rogowski coil) and a casing containing an electronic processing unit. Unlike current clamps using magnetic circuits, the AmpFlex® models are flexible sensors without magnetic saturation constraints. As a result, they offer excellent linearity, low phase shift, a large dynamic range for measurement (up to several kA) while remaining easy to use. The sensors' flexibility makes it easy to clamp the conductor, whatever its type (cable, busbar, strand, etc.) and access conditions.

The design of the click-together opening and closing system means it can be handled with protective gloves.

The AmpFlex® A110 can be connected to the AC voltage input (mV AC, V AC) of any multimeter or measuring instrument equipped with Ø 4 mm female banana plugs.

The AmpFlex® A110 can be powered by batteries or a standard external power supply. If the power supply fails, the instrument's batteries take over. To maximize the battery life, the MiniFlex® A110 has an automatic standby system which can be deactivated at start-up to perform long-term measurement campaigns.

The MiniFlex® A110 has 3 green, yellow and red LEDs indicating, respectively, the power supply status, the status of the automatic standby function and any overruns of the measurement capacity.

**AC/DC current probes**

**K series**

The K series is a new product range with exceptional measurement capabilities. Extremely compact in design, these “micro-probes” are designed for highly accurate measurement of very low currents. Their small dimensions and shape make them ideal for probing into tight spaces where access is limited, as is the case on most switchboards, 4-20 A process loops or vehicle wiring looms for example. These “K” series current probes make excellent work companions for multimeters and any other instrument able to make use of their high sensitivity, dynamic range and ability to indicate the shapes of signals and waveforms.

They give an AC+DC output signal that is proportional to the measured current, without needing to change the range or filter the signal. RMS measurements are possible with DC+AC components. There are two different types of K series current probes available. Model K1 gives a 1 mV/mA output and lends itself to a variety of different applications, oriented towards low-current measurement. Model K2 has a greater level of sensitivity with its 10 mV/mA output.

**Model K1**

**DESCRIPTION**

The K1 model measures currents as low as 100 µA AC or DC. The clamp provides a proportional output signal enabling direct readings on multimeters.

**ELECTRICAL SPECIFICATIONS**

- **Current calibres:**
  - 1 mA DC .. ± 4.5 A DC
  - 1 mA rms .. 3 A rms (sinusoidal)
  - 1 mA .. 4.5 A peak, square and steps

- **Output (output voltage):**
  - ±1 mV/mA

- **Resolution:**
  - DC: 50 µA typical
  - AC: 100 µA typical

- **Accuracy:**
  - DC current:
    - ±2 % over range
  - AC current from 45 Hz to 65 Hz:
    - ±3 % over range

- **Frequency response:**
  - DC to 2 kHz (at -3 dB)

- **Load impedance:**
  - ≥ 1 MΩ and ≤ 100 pF

- **Output noise:**
  - < 100 µV at 3 kHz

- **Output impedance:**
  - 220 Ω

- **Inductance of clamp:**
  - < 1 µH

- **Rise time:**
  - < 200 µs, 10 % at 90 %

- **Fall time:**
  - < 200 µs, 90 % at 10 %

- **Influence of adjacent conductors:**
  - (50 Hz at 23 mm from the clamp): < 100 µA/A

- **Influence of earth field:**
  - < 120 µA

- **Battery:**
  - Alkaline 9 V, NEDA 1604, LR61 or IEC 6 LF22

- **Low battery signal:**
  - Green LED when battery voltage > 6.5 V

- **Battery charge life:**
  - Approximately 20 hours

- **Overload indication:**
  - Red LED indicating momentary or continuous overload

- **Max. current:**
  - 200 A AC or DC with current limitation according to frequency, above 400 Hz

**MECHANICAL SPECIFICATIONS**

- **Operating temperature:**
  - -10 °C to +55 °C

- **Storage temperature:**
  - -40 °C to +80 °C

- **Influence of temperature:**
  - < 1,000 ppm/°K or 1 %/10 °C

- **Humidity:**
  - < 95 % for < 35 °C, 75 % at +55 °C

- **Operating altitude:**
  - 0 to 2,000 m

- **Adjustment of DC zero:**
  - Approximately ±25 mA by turning the button on the bottom of the housing

- **Max. jaw insertion capacity:**
  - Ø 3.9 mm

- **Protection rating:**
  - Casting: IP 40 in accordance with IEC 529

AC/DC current clamp model K2 in carrying case with battery and user’s manual

**Reference**
P01120074A
The EN series clamps use Hall-effect technology for the measurement of AC and DC currents from several milliamps to over 100 A.

These clamps’ narrow, elongated design makes them ideal for measurements in cable bundles or in other confined areas like circuit boards, motor controls or motor vehicle electrical circuits.

Their low phase shifting also ensures excellent performance for power measurements.

These clamps have a voltage output (mv) and their ability to measure AC and DC signals is useful for true RMS measurements. Model E6N is the most sensitive for low current measurements.

The E series clamps all make excellent work mates for multimeters, recorders and logging equipment, etc. Model E3N can even be connected directly to an oscilloscope.

DESCRIPTION

The E3N clamp is designed to measure AC and DC currents by using Hall-effect technology. Its narrow, elongated shape makes it ideal for measurements in cable bundles or in confined spaces such as the wiring on switchboards, motor control units and electrical circuits on motor vehicles. It is particularly appreciated for its True RMS measurements on AC+DC signals. It offers 2 different sensitivities.

MH SERIES

The MH60 clamp is designed to measure DC and AC currents up to 1 MHz using dual Hall effect/Transformer technology.

It includes an internal NiMh rechargeable battery and can be recharged or powered using a 5 VDC power supply via the female type-B μUSB connector with which it is equipped.

It has an automatic standby system (which can be deactivated), an automatic “DCzero” system for compensation of magnetic and electronic drift, a switchable selective filter (3 kHz, 30 kHz) and a system for compensating the effects of the earth field and other constant DC fields.

Its ability to measure AC+DC signals is useful for True RMS measurements.

The PAC series is a range of professional AC/DC current clamps. There are two different jaw designs available for clamping cables and small busbars. The PAC series clamps operate on the Hall effect principle, allowing current measurement up to 1,500 A DC and 1,000 A AC. The electronics and the batteries are all located in the clamp handles. There are two sensitivity levels available: 1 mV/A and 10 mV/A.

A push button operates the automatic DC zeroing on models PAC 11, 12, 21 and 22. Models PAC 10 and PAC 20 have potentiometer-operated zero adjustment. TRMS measurement with the DC component is possible using a multimeter or power meter with suitable capabilities. Models PAC 12 and PAC 22 are designed for use with oscilloscopes and other BNC-input instruments.

CLAMP ACCESSORIES

Having made test, control and measurement instruments for over a century now, Chauvin Arnoux products are the result of years of experience in the field. A knowledge of measurement techniques and daily experience in safety practices has led to the development of an entire range of practical and safety-conscious test accessories. Throughout the range, from the artificial neutral to the BNC/ female safety socket, or silicone leads with banana plugs (straight or elbowed), the IEC 61010 standard is the benchmark by which all products are judged.

However, even a device that complies with this standard does not guarantee complete safety, so make sure that you are equipped with suitable accessories with which you can verify that your equipment meets the most demanding safety standards.
Mains adapters

For unlimited operation of your current clamps, replace the battery with the mains adapter.

**Artificial neutral box**

**Model AN1**

---

**DESCRIPTION**

This instrument is designed for use with MN73, C173 and B102 leakage-current detection clamps to enable fault current measurements on 3-phase circuits without a neutral conductor.

There is a switch for selecting the test rate so that the MN73, C173 and B clamps can be used with digital or analogue multimeters.

A built-in buzzer indicates when the artificial neutral is connected to the earth. Three LEDs indicate when a voltage is present on each of the 3 phases and during measurement.

**Portable test and measurement instrumentation**

**CHAUVIN ARNOUX** draws on its two brands, Chauvin Arnoux® and Metrix®, to propose a wide range of measuring instruments. The offering covers electrical measurement (testers, multimeters and current clamps), electrical safety checking, wattmeters and electrical network quality analyzers. Oscilloscopes, electronic equipment testers and environmental measurements complete the range of its expertise.

**Temperatures in industrial processes**

**PYROCONTROLE** proposes tailored solutions for the temperature measurement and control requirements of all process industries. A wide range of sensors and total mastery of the industrial process chain make **PYROCONTROLE** an essential partner for industries such as the nuclear sector, petrochemicals, glass-making, metallurgy, etc.

**Metrology and regulatory testing**

**MANUMESURE** is the **CHAUVIN ARNOUX** Group company specialized in metrology and regulatory testing. Its offering is structured around three major market segments: Industry, Environment and Health.

**Metering, measurement and energy performance**

**ENERDIS** designs measuring instruments for electrical switchboards and develops smart systems for electricity metering and mastery of energy flows in order to keep consumption under control.
